HOW TO COMPACT AND SHRINK THE SIZE OF A VHD FILE

In a recent blog post, How to Expand a Disk within a VM That Is Using a VHD File, I showed you how to expand a VHDX file in logical disk size. I did this because I had a problem with the auto-growth of my SQL Server logs. Now that this problem is fixed, I want to return the VHDX file back to its normal logical size of 128GB, and make the VHDX file as small as possible. This blog post will show you how to shrink the size of a VHD file.

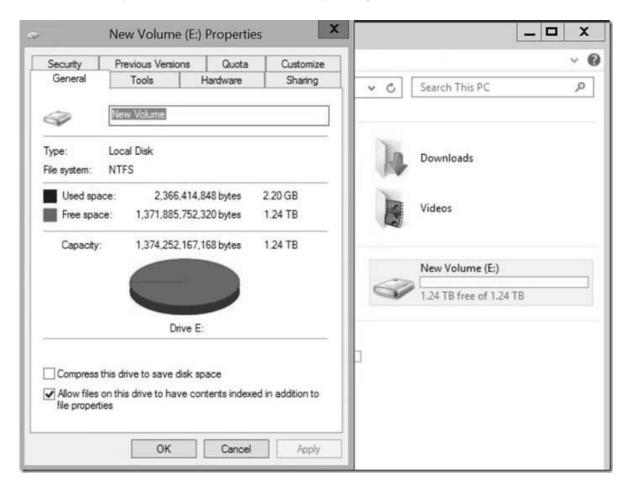

I can hear some of you saying, "Why? You are using a dynamically expanding VHDX file, so why bother compacting and shrinking the file?"

REFRESHER

As a refresher, remember that a dynamically expanding VHDX file will start at a few MBs and grow as files are added to the virtual hard drive. If you delete a file within the virtual hard drive, the space is freed up only with the virtual hard drive and not from the physical VHDX files. To put it another way, once the VHDX file is expanded, it will never shrink without you following these steps.

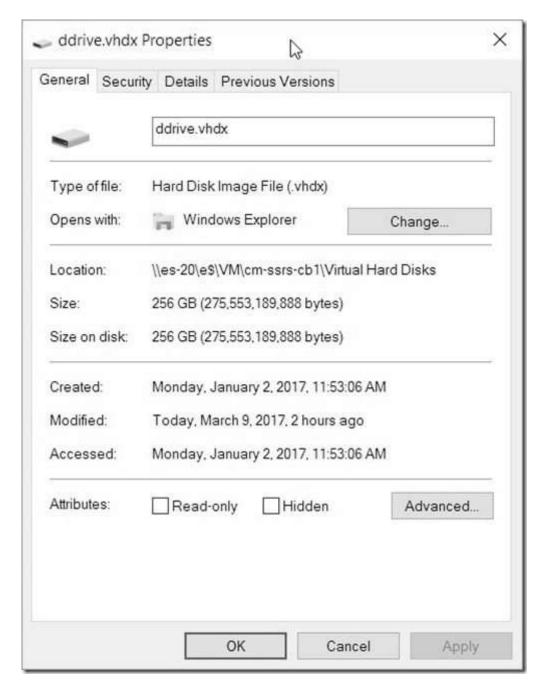

Here are a few reasons why you would want to shrink the VHDX file:

- · Shrinking the VHDX file to the smallest possible size will save disk space on the host.
- · A small VHDX file leads to faster backups. 3GB is a lot faster to copy than 128GB or 256GB.
- · If a problem like the SQL Server log auto-growth happens again, I want to know about it sooner rather than later. By having a small logical VHDX file size, this problem will be seen, hopefully, earlier.

HOW TO COMPACT SIZE OF A VHD FILE

To begin with, I always recommend that you never install anything on the C:\ drive. It can be a huge pain to logon to a server when the C:\ drive is out of space. This of course will depend on your GPO security settings! In my blog post, How to Expand a Disk within a VM That Is Using a VHD File, I expanded my VHDX file to 1.2TB. In a later blog post, What Is the Problem with My SSRS Server?, I cleaned up the SSRS log file, thereby returning the server to its normal operating state. The screenshot above shows you that I cleaned up my virtual hard drive and that 1.24TB are free and only 2.2GB of space are used.

Now looking at the physical VHDX file, I can see that it is 256GB in size (of a possible 1.2TB), but in the first screenshot you can see it's using a little over 2.2GB of space within the VHDX file. Using the processes below, I

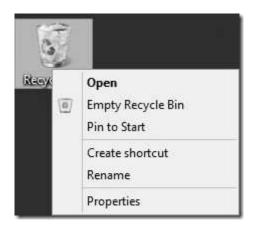

will first shrink the volume size to 128GB then compact the physical VHDX file to the smallest possible size.

How do you go about this process? In a nutshell, I will perform the same steps I did to expand the VHD, but in reverse. I need to start with the VM itself by cleaning-up, defragging and shrinking the volume size.

VM CLEAN-UP TASKS

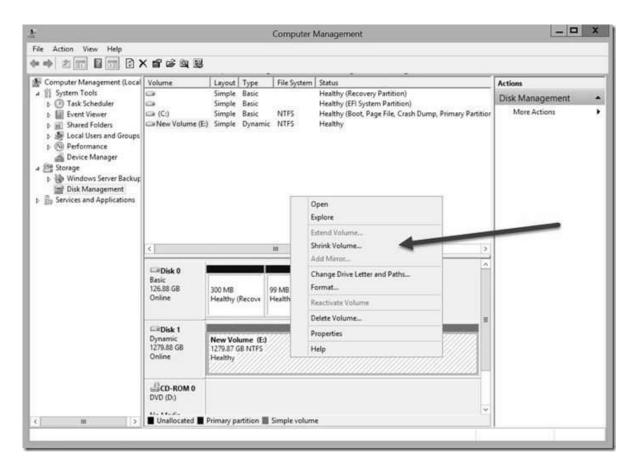

There are several things to note before getting started:

- You should make a copy of the VHDX file before starting, or have a good backup of the server.
- Within the VM make sure that the **Recycle Bin** is emptied.

- You need to defrag the drive BEFORE shrinking the volume size and compacting the VHDX file.
- Multiple defrag passes might be needed.
- If the disk has any issues, it will **NOT** shrink or compact. Make sure that chkdsk is run.

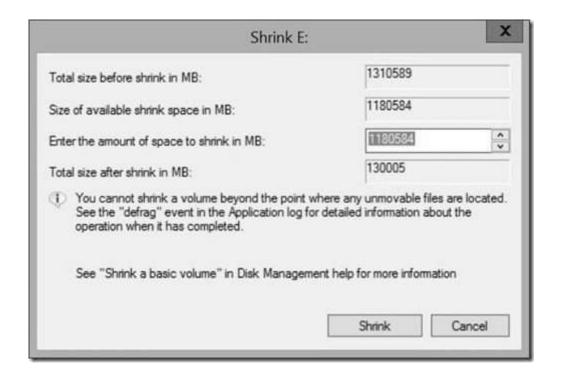

SHRINK THE VOLUME SIZE

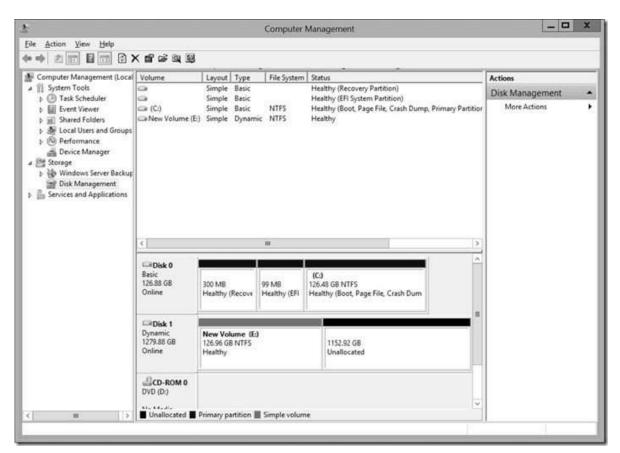

Open **Computer Management** and select the **Disk Management** node. Next, select volume (E:), right click on it and select **Shrink Volume...**

Wait for **Computer Management** to analyze the volume.

I will select the suggested new size. Click **Shrink** to continue.

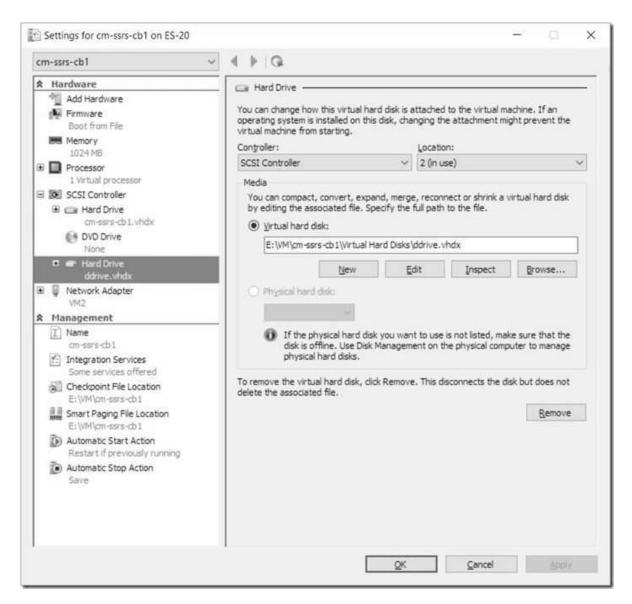

Now my disk is back to 128GB in size. Time to compact the VHDX file. I'll

start by shutting down the VM.

COMPACT THE VHDX FILE

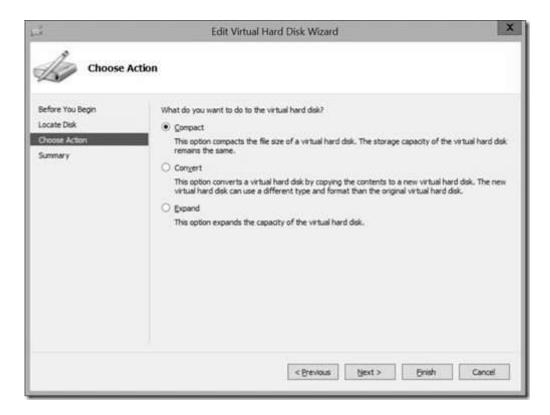

These next set of steps will reduce/compact the physical size of the VHDX file.

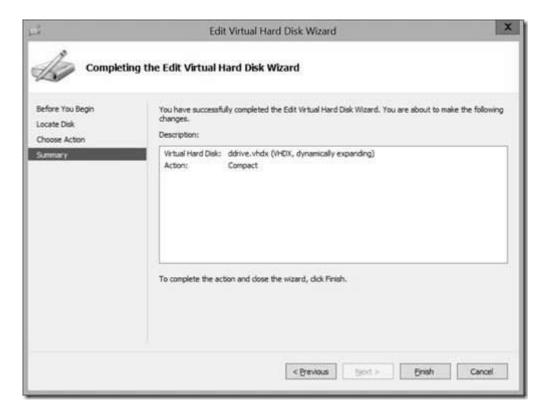

In Hyper-V Manager, bring up the **Settings** page for the VM. Click on the **Edit** button.

| rii. | Edit Virtual Hard Disk Wizard | X |
|------------------|---|---|
| Locate V | /irtual Hard Disk | |
| Before You Begin | Where is the virtual hard disk file located? | |
| Choose Action | Location: Et VM (cm-sers-cb1)/intual Hard Daks (ddrive, vhdx [groves | |
| Summery | Editing the following types of virtual hard disks might result in data loss: Virtual hard disks in a differencing disk chain that have child virtual hard disks associated with them. Virtual hard disks ("avhd/"avhdx") associated with virtual machine checkpoints. Virtual hard disks associated with a virtual machine that has replication enabled and is currently involved in initial replication, resynchronization, test fallover, or fallover. | |
| | < Brevious Bext > Cancel | |

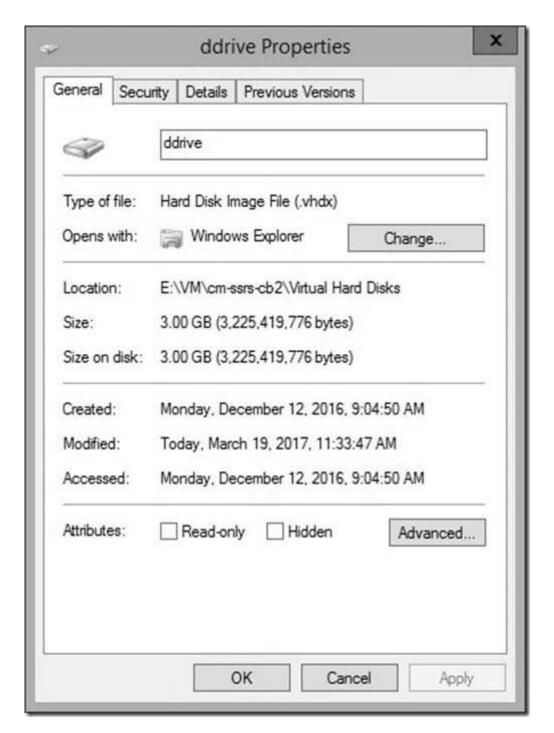

Click Next.

Select **Compact** and then click **Next**. This will reduce the phyiscal size, but not the logical size of the VHDX file.

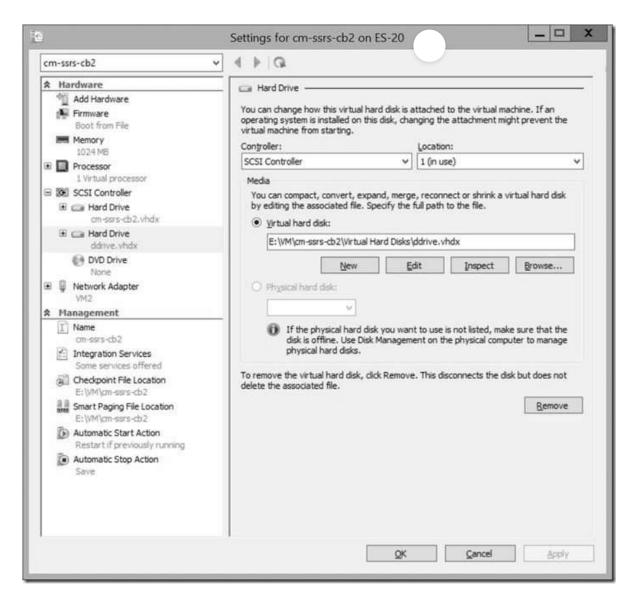

Click Finish.

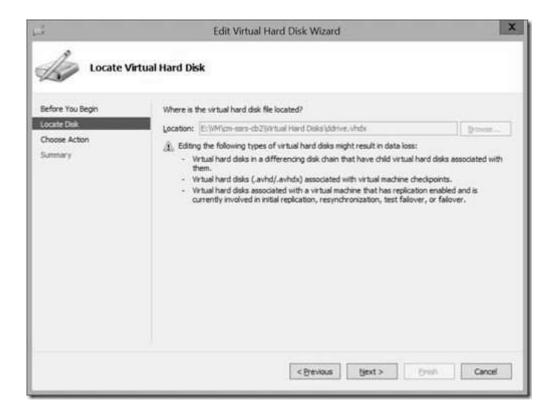

Now if you look at the VHDX's file size, it was reduced to the bare minimum size of 3GB. Keep in mind that your minimum size may be different.

SHRINK THE SIZE OF A VHD FILE

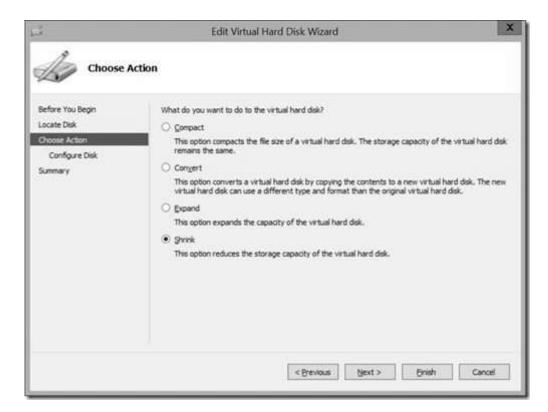

These next steps will shrink the logical size of the VHDX file.

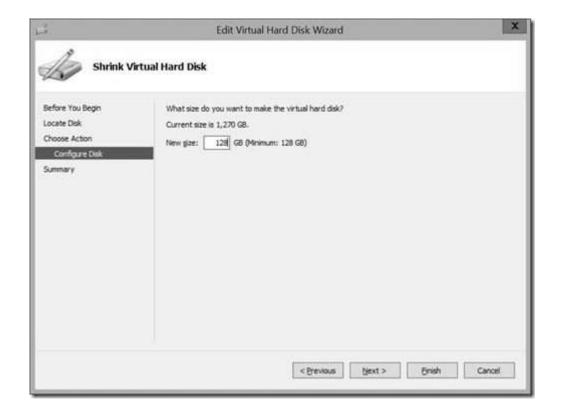

Again, in Hyper-V Manager, bring up the **Settings** page for the VM. Click on the **Edit** button.

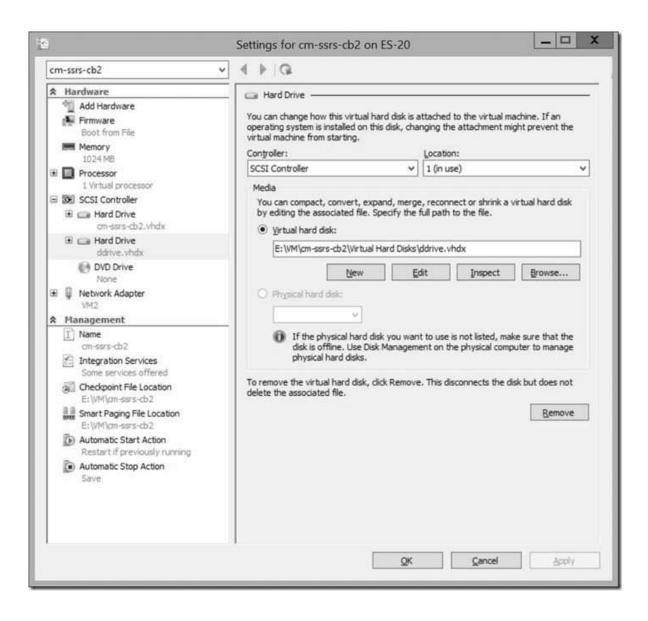

Click Next.

Select Shrink and then click Next.

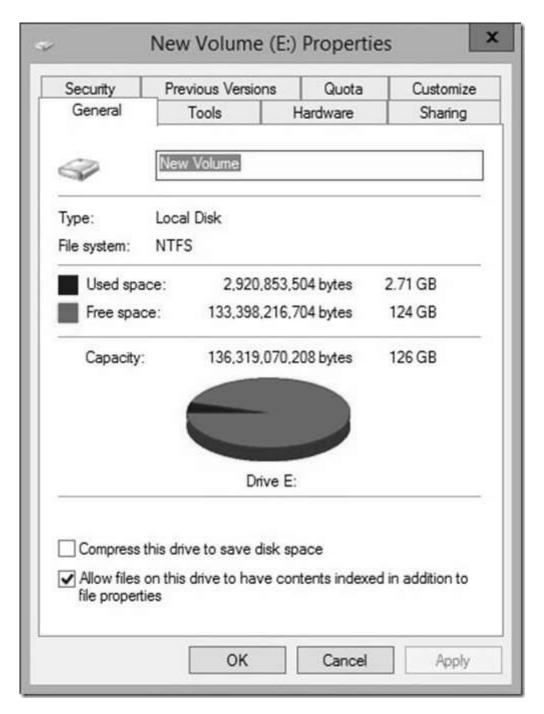

Set the New size to 128GB, and then click on the Finish button.

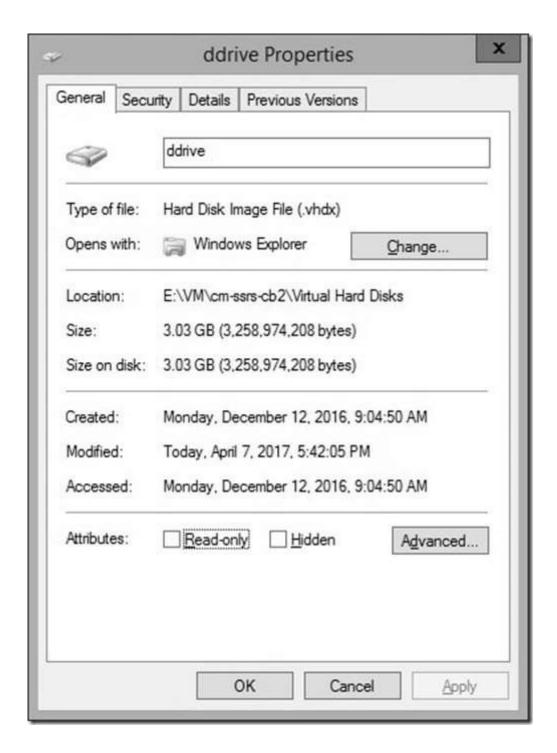

Click **OK** to close the VM's **Settings** window. Now start the VM.

REVIEW VOLUME SIZE

After logging onto the VM, review the disk size. Notice that it is back to its original size.

Now look at the physical VHDX file (see screenshot above). It is now 3.03GB in size. When you compare this to the 256GB it was at the beginning of this blog post, that's a huge size difference. This will help make my backups faster due to the smaller file size!

If you have any questions about how to shrink the size of a VHD file, please feel free to contact me @GarthMJ.

I have also written on this topic, and have found that it is pretty easy to compact vdisks from within a command prompt using diskpart. I prefer the method below. I like the fact that you don't need to shrink partitions in your vdisk and you don't even need to zero out unused disk space.

From an elevated command prompt type:

diskpart
select vdisk file="C:\Hyper-V\sampledrive.vhdx"
attach vdisk readonly
compact vdisk
detach vdisk
exit

This process reduced the size of my Master Image from 24GB to 15GB and takes seconds. It may sound too good to be true but I would be very happy to hear back from you if it worked for you. The article I published on the matter is at:

https://www.alaskacomputerguy.com/category/howto/how-to-compact-vhdx
